Answer Key

1.	D	8.	D	15.	D
2.	C state out all grows				
3.	D	10.	Booking assess	17.	A
4.	E	11.		18.	
5.	C	12.		19.	E
6.	В	13.	A	20.	В
7.	E	14.	В	21.	D

Answer Explanations

- (D) The methods are deposit, withdraw, and getBalance, all inherited from the BankAccount class, plus addInterest, which was defined just for the class SavingsAccount.
- 2. (C) Implementation I fails because super() must be the first line of the implementation whenever it is used in a constructor. Implementation III may appear to be incorrect because it doesn't initialize interestRate. Since interestRate, however, is a primitive type—double—the compiler will provide a default initialization of 0, which was required.
- 3. **(D)** First, the statement super(acctBalance) initializes the inherited private variable balance as for the BankAccount superclass. Then the statement interestRate = rate initializes interestRate, which belongs uniquely to the SavingsAccount class. Choice E fails because interestRate does not belong to the BankAccount class and therefore cannot be initialized by a super method. Choice A is wrong because the SavingsAccount class cannot directly access the private instance variables of its superclass. Choice B assigns a value to an accessor method, which is meaningless. Choice C is incorrect because super() invokes the no-argument constructor of the superclass. This will cause balance of the SavingsAccount object to be initialized to 0, rather than acctBalance, the parameter value.
- 4. **(E)** The constructor must initialize the inherited instance variable balance to the value of the acctBalance parameter. All three segments achieve this. Implementation I does it by invoking super(acctBalance), the constructor in the superclass. Implementation II first initializes balance to 0 by invoking the no-argument constructor of the superclass. Then it calls the inherited deposit method of the superclass to add acctBalance to the account. Implementation III works because super() is automatically called as the first line of the constructor code if there is no explicit call to super.
- 5. **(C)** First the withdraw method of the BankAccount superclass is used to withdraw amount. A prefix of super must be used to invoke this method, which eliminates choices B and D. Then the balance must be tested using the accessor method getBalance, which is inherited. You can't test balance directly since it is private to the BankAccount class. This eliminates choices A and E, and provides another reason for eliminating choice B.
